PROFESSIONAL SUMMARY

Mobile engineer with 4+ years of experience shipping production applications across low-code enterprise platforms, e-commerce, fintech, and pharma. Currently the sole mobile lead at Senpiper, owning iOS and Android for a multi-tenant low-code platform: designed a Kotlin Multiplatform (KMP) core for a new V2 form schema and built a police beat-management app from scratch on the platform's form engine. Earlier: Nykaa consumer app (UIKit and SwiftUI, Nike payments checkout), a KMP onboarding and KYC SDK as the only iOS engineer, a live 4.9-rated pharma app as sole iOS developer, and Google Home (100M+ downloads) on a 20-engineer iOS team. Strong in legacy Objective-C, UIKit-to-SwiftUI migrations, server-driven UI, and cross-platform architecture.

SKILLS

Languages	Swift, Objective-C, Kotlin, Java, C, Shell
Frameworks	SwiftUI, UIKit, Combine, Cocoa Touch, Core Data, GCD, Kotlin Multiplatform (KMP), Jetpack Compose, Android SDK
Architecture & Design	MVVM, MVC, SOLID, DRY, Clean Architecture, Schema-driven UI, Low-code Form Engines, Delegate-Protocol, Feature Flags
Tools & Testing	Xcode (Instruments, Debugger), Android Studio, Git, Firebase, EarlGrey, Figma, Jira, RESTful APIs, GraphQL, XCTest, DSA, Scripting Automation, Auto Layout, Interface Builder

EXPERIENCE

Lead Mobile Engineer (iOS & Android) | Senpiper Feb 2026 – Present

- Sole mobile lead for the iOS and Android apps of **One Resource**, Senpiper's multi-tenant low-code platform for forms, workflows, and business process automation used by government, consulting, and banking clients.
- Onboarded with no knowledge-transfer sessions and a codebase that would not build locally; debugged the build and environment issues, studied the architecture from shared documentation, and got both apps running across simulators, emulators, and physical devices.
- Audited both codebases, which were full of workarounds, duplicated logic, and non-modular code, and drove a unification effort based on DRY and SOLID principles.
- Designed a **Kotlin Multiplatform (KMP)** architecture to support the new **V2 form schema**, replacing a deeply nested recursive JSON schema that carried styling, dependent keys, and workflow definitions. Schema parsing, the form-rendering runtime, and core logic now live in a single shared layer with thin native UI on each platform, removing the need for per-client branches and parallel fixes on iOS and Android.
- Built the **form editing workflow** on both iOS and Android.
- Built a **real-time form-filling viewer** that lets reviewers watch fields update live while a form is being filled.
- Built **Beat** from scratch, a police-department app for managing officer beats, leave applications, and HR services, on top of the low-code form engine; feature flags select the Beat-specific flows so one engine serves a fully separate product.
- Delivered additional UI and core features across both platforms while owning architecture, delivery, and releases as the single mobile lead.

iOS Developer | Nykaa Jun 2025 – Feb 2026 · Gurugram

- Shipped features across product listing, detail, and search in both UIKit and SwiftUI during a live phased migration, implementing a dual-framework feature-flag system so every screen existed in both frameworks simultaneously.
- Engineered config-driven UI via Firebase Remote Config, enabling dynamic content updates, A/B testing, and controlled feature rollouts without an app release.
- Integrated Nudges SDK, universal deep links, and stories feature; owned the full delivery lifecycle from PRD to API contracts, development, and QA.
- Contributed to Payments SDK modernisation toward a single-page checkout (UPI / Card / COD), with hands-on exposure to Razorpay, Cashfree, and Cards SDK integration across multiple app targets (Nykaa, Nike Fashion, Nike India).

- Delivered the Nike India checkout UI end-to-end, revamping the payment page into a single-page layout with pixel-perfect compliance to Nike's strict brand and UX guidelines.
- Upheld production-grade code standards (ARC optimisation, thread safety, app lifecycle management) alongside automation scripts that improved team workflow efficiency by 12%.

KMP / Mobile Developer | Punch Trade (Market Pulse)

Jun 2024 – Feb 2025 · Mumbai

- Joined as the iOS engineer to extend an Android trading app to iOS using Kotlin Multiplatform (KMP), driving cross-platform architecture decisions.
- Architected KMP shared modules and migrated Android logic to common code, reducing duplication and accelerating feature delivery.
- Built the iOS layer of an 8-step onboarding & KYC SDK in SwiftUI (Aadhaar, PAN, DigiLocker, e-sign, banking), reducing onboarding time by 24%.
- Delivered 15+ features via A/B testing in collaboration with product, increasing user engagement by 22% and product growth by 12%.
- Developed a modular, resizable widget framework displaying real-time F&O data, positions, P&L, and options charts across multiple layouts.
- Contributed to a unified single-screen trading experience across iOS and Android.
- Expanded scope to Android, building Jetpack Compose modules and improving team efficiency (~20%) through reusable systems and faster tech adoption.

iOS Developer | Yanthraa Information Systems

Nov 2023 – May 2024 · Hyderabad

- Sole iOS developer on InpharmD (4.9 rating, 1,000+ users); built the full app: article listing with dynamic tag filtering, search, and detailed views.
- Integrated 20+ REST APIs end-to-end and developed dynamic, data-driven UI components using UIKit.
- Led migration from Objective-C to Swift to overcome framework limitations, improving scalability and enabling new feature development.
- Resolved 30+ production issues, improving app stability by ~8% and UI responsiveness by ~12–20%.
- Delivered 10+ features in collaboration with clients and cross-platform teams, ensuring feature parity with Android.

iOS Developer | Raja Software Labs

May 2022 – Oct 2023 · Pune

- Part of a 20-engineer iOS team on Google Home (100M+ downloads), contributing to a large-scale Objective-C/Swift hybrid codebase.
- Owned key areas of the OBE (Out-of-Box Experience) device setup flow using JSON/Proto-driven dynamic screen definitions.
- Built and shipped the CameraZilla feature end-to-end behind feature flags, including camera setup and live feed modules.
- Debugged AVPlayer issues for live camera streaming and video playback, handling complex edge cases in production.
- Delivered 15+ features across Nest, Chromecast, and camera flows, reducing setup time by 15% and improving response time by 20%.
- Resolved 100+ bugs in a large Objective-C codebase, significantly improving stability and app performance.
- Leveraged advanced Xcode tooling (Instruments, LLDB, profiling) and applied MVVM/MVC patterns for scalable, maintainable development.

EDUCATION

B.Tech, Computer Science (AI Specialisation) · Mediacaps University, Indore · Distinction, May 2021

Full-Stack Web Development (MERN) · Acciojobs · May 2022
