

Software engineer, **4+ years shipping production apps** (Google Home 100M+ downloads, Nykaa, KMP fintech), now working as a **forward-deployed engineer**: I scope the problem with the customer, then **orchestrate AI agent fleets** — frontier models planning and reviewing, cost-efficient models executing — to deliver **deployed, working systems** end-to-end. **Five live products** shipped this way (full-stack SaaS, e-commerce with a live database, realtime apps). Mobile lead by track record; agent-native by method.

01 DEPLOYED SYSTEMS — BUILT WITH AGENT FLEETS, LIVE NOW

|                                                                                                                      |                                                                                                                                                                                                                                                      |

02 AGENT ENGINEERING — THE METHOD

|                      |                                                                                                                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Orchestration</b> | Command parallel subagent fleets with isolated contexts: frontier models (Claude Code, Codex) plan, review, and steer; cost-efficient coding workers execute. I am the architecture owner and review gate — nothing ships unverified. Tools: Hermes, Claude Code, Codex, Cline, OpenCode. |
| <b>Harnesses</b>     | Build custom harnesses around model APIs — context management, token discipline, retry loops, prompt scaffolds — and stress-test every new agent framework on release. MCP servers, local + cloud model routing.                                                                          |
| <b>Models</b>        | Drive local models end-to-end (Ollama for inference, ComfyUI for diffusion/image generation) alongside frontier APIs, routing work to the cheapest model that meets the bar and escalating when quality demands it.                                                                       |
| <b>Field kit</b>     | macOS + Docker/Colima; NestJS, Next.js, React 19, TypeScript, Prisma, Supabase/Postgres, Vercel/Netlify/Render deploys; CI discipline (lint, typecheck, conventional commits).                                                                                                            |

03 EXPERIENCE

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                    |

| <b>Lead Mobile Engineer — iOS &amp; Android</b> <span>Senpiper</span>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Feb 2026 — Present |
| <ul style="list-style-type: none"><li>Sole mobile lead for <b>One Resource</b>, a multi-tenant low-code platform (forms, workflows, process automation) for government, consulting, and banking clients. Own both apps, architecture, and all App Store / Play releases.</li><li>Onboarded with <b>zero knowledge transfer</b> and a codebase that would not build: debugged the build, unified duplicated logic on DRY/SOLID principles, and got both platforms shipping.</li><li>Designed a <b>Kotlin Multiplatform architecture</b> for the V2 form schema — schema parsing, form runtime, and core logic in one shared layer, thin native UI per platform; removed per-client branching.</li><li>Built <b>Beat</b>, a police beat-management / leave / HR app, from scratch on the form engine via feature flags — one engine, a fully separate product. Real-time form-filling viewer so reviewers watch fields update live.</li><li>Runs <b>agentic AI workflows</b> (Claude, Codex, Ollama; cloud + local models) as the daily delivery loop — authored orchestration methods and ADRs reusable across tools and repos.</li></ul> |                    |

iOS Developer

Nykaa

Jun 2025 – Feb 2026

- Shipped listing, detail, and search features in a live **UIKit→SwiftUI migration** — dual-framework feature-flag system so every screen existed in both simultaneously.
- Delivered the **Nike India checkout UI end-to-end** (single-page payments layout, pixel-perfect against Nike brand/UX rules); contributed to Payments SDK modernisation (UPI/Card/COD; Razorpay, Cashfree).
- Config-driven UI via Firebase Remote Config for A/B tests and rollouts without releases; automation scripts improving team workflow efficiency **+12%**.

KMP / Mobile Developer

Punch Trade (Market Pulse)

Jun 2024 – Feb 2025

- Extended an Android F&O trading app to iOS with **Kotlin Multiplatform**; architected shared modules, migrating Android logic to common code.
- Built the SwiftUI layer of an 8-step **onboarding & KYC SDK** (Aadhaar, PAN, DigiLocker, e-sign, banking) — onboarding time **-24%**.
- Resizable realtime widget framework (F&O data, positions, P&L, options charts); 15+ A/B-tested features lifting engagement **+22%**; expanded to Jetpack Compose modules on Android, team efficiency **~+20%**.

iOS Developer

Yanthraa Information Systems

Nov 2023 – May 2024

- Sole iOS developer on **InpharmD** (4.9★, live on the App Store); led the Objective-C→Swift migration, integrated 20+ REST APIs, built data-driven drug-information UI.
- Resolved 30+ production issues — stability **+~8%**, UI responsiveness **+12-20%**.

iOS Developer — Raja Software Labs

Google Home

May 2022 – Oct 2023

- 20-engineer team on the **Google Home iOS app (100M+ downloads)**; owned OBE device-setup flows built on JSON/Proto-driven dynamic screen definitions; shipped the CameraZilla feature behind feature flags.
- Debugged AVPlayer live-streaming edge cases; 15+ features across Nest/Chromecast/camera flows — setup time **-15%**, response time **-20%**; resolved 100+ bugs in the hybrid ObjC/Swift codebase.
